

App Brief: Duet — Wedding Singer Booking App (working title)

Product Description

Duet is a booking app that helps singer/pianist duos who don't yet have a wedding client network get discovered by couples planning receptions. It matches duos with couples looking for live music for their date, lets couples view the duo's profile and repertoire, and lets both sides message and book directly in the app.

Core Concept (lead with the value)

- **Fundamental Value: Visibility.** The duo becomes discoverable to couples actively looking for a wedding singer, closing the gap between having a ready act and having no way for anyone to find it.
- **Need:** Singer/pianist duos have their repertoire, pricing, and act ready, but with no existing wedding network, finding weddings to perform at — and becoming known in the first place — is slow and depends on luck or scattered personal connections.
- **Persona:** A singer/pianist duo that has everything else in place (repertoire, pricing, sound) except an existing pipeline of weddings to perform at.
- **Capability:** Matches the duo with couples looking for a wedding singer, and lets them view the couple's details, communicate, and book — all inside the app.

The Three Screens

Screen	Job	Design Question It Answers
1. Landing (first open)	Signal, before a first-time user does anything else, that this app makes them discoverable to couples looking for a singer — not a login screen, not a feature list.	Does the landing screen communicate the primary capability and value at first glance, before reading any body copy?
2. Matches	Show a set of real, specific wedding opportunities matched to the duo's profile	Do related pieces of each match (date, style, budget fit) group visually so the duo can

Screen	Job	Design Question It Answers
	(date, style, budget) — proof the matching works, not just a promise.	scan and evaluate quickly, and does the grouping read as curated rather than generic?
3. Match Detail + Message/Book	Let the duo view one couple's wedding details and act — message or request to book — closing the loop from "discovered" to "booked."	Is the primary action (message/book) the obvious next step, and does nothing on the screen compete with it?

All three screens need obvious navigation back to the Landing screen, and should read as the same product (consistent type, color, spacing).

Tone, Color, Content Preferences

- Overall feel: warm, romantic, understated — not corporate, not twee.
- Palette: warm off-white background, one rose/berry accent color for primary actions and highlights, dark neutral text. No gradients, no emoji, no rounded-card-with-left-border clichés.
- Typography: a serif display face (e.g., Playfair Display) for headlines, clean system sans-serif for body text.
- Content: real-feeling sample data (specific couple names, real-sounding venue names, dates) rather than lorem ipsum or generic placeholders.
- No fake phone status bars or fake keyboards in the mockup.

Instruction to the Agent

The affordance sentence — the single sentence that tells a first-time user what this app does and why it matters to them — is the dominant thing on the landing screen. Nothing else on that screen should compete with it for attention.
